

Type Tables

Type tables are a sub-class of primary tables. They hold information that is not modified on a regular basis (or ever) and is used as a reference for possible values.

They can be thought of as enums.

Type tables work well for dynamically populating lists and dropdowns of possible values on websites instead of hard-coding values.

An example type table is given below.

Type_Campus

- CampusId (key)
- Campus
- CampusCode
